

A Mistake Always Returns

Perpetual Motion Machine?

Refined conceptual version: the Big Bang is not the beginning of space, but the beginning of entropy - a break in a closed geometric cycle.

- Black - particle ●
- Red - dark energy ●
- Purple - center / white hole? ●
- Yellow - waterfall / wormhole ●
- Blue - space ●
- Green - circle / universe ●

The ideal version of the claim

In one sentence

The universe did not begin as empty nothing suddenly becoming space. It began as a closed, cyclic, quiet geometric state with no active arrow of time. The Big Bang is the moment this cyclic state broke, and space, previously spread as a static possibility, became an irreversible entropic process.

What changed in this version

Instead of saying that space “moves” like an object inside another space, the refined version speaks about the dynamics of geometry itself: stretching, folding, topological shortcuts, and metric change. This avoids the need for an outside reference frame.

Core assumption

Before the Big Bang there was not “nothing”, but a state without history: a closed structure in which time has no direction yet. The system exists as organized potential, but without a break there is no story, no before and after, and no entropy as we experience it.

Precise vocabulary

Space

Space is not matter and not a ball moving inside something else. In this model, “space” means the geometry of possibility: the structure in which relations, distances, and processes can appear.

Circle / perimeter

The circle is not a two-dimensional drawing of a physical wall. It represents a closed cycle in the space of possible states. The perimeter is a topological boundary: a point where cyclic motion can become transition.

Waterfall / wormhole

The waterfall is not ordinary motion faster than light. It is a topological shortcut: a transition in which the path from perimeter to center is not measured like normal motion around the circle.

The sequence

Stage 1 - closed state

Space is spread through a closed geometric cycle. There is no explosion, no expansion, and no active arrow of time. The system is stable because it returns to itself.

Stage 2 - the trigger

A quantum instability on the perimeter of the cycle enters the waterfall. This is not merely an ordinary particle; it is a local deviation in the closed state, a point where possibility stops staying on the track and slips into the shortcut.

Stage 3 - the center

The transition through the waterfall returns the dynamics to the center of the system. The center behaves like a conceptual point of release, or a white-hole-like state: not a place inside space, but a condition where cyclicity becomes event.

Closing the main holes

No outside of the universe

The model does not require space to move relative to something external. “Motion” means internal geometric change: the metric of space changes, folds, or passes through a transition.

No violation of light speed

There is no claim that a body locally travels faster than light. In the waterfall, the path is shorter because the topology is different. The effective transition therefore need not violate a local speed limit.

No simple physical edge

The perimeter is not a wall at the edge of the universe. It is a boundary in the model: the place where a cyclic state can become a fall. It is the edge of a process, not necessarily the edge of space.

What remains open

The real weakness

The model is still not complete physics. It lacks mathematics: a metric, boundary conditions, a conservation law, and a precise account of the quantum instability. It is therefore not a proof, but a sharpened conceptual proposal.

What would break it

If the center, perimeter, and waterfall cannot be defined consistently without contradicting general relativity and thermodynamics, the theory remains only a beautiful metaphor. If they can be defined, it becomes an interesting candidate for a speculative cosmological model.

Final formulation

The universe was not born when space appeared. It began when a closed cycle of space broke into itself, and that mistake created time.
